

OgunScan Shield

Setup & Activation Guide

Plan: **Shield**

Welcome to **OgunScan Shield** — your MCP server security scanner. This guide walks you through getting set up in under 5 minutes. Keep your license key safe — you'll need it to activate Shield on each machine.

1 Check Your License Key

After purchase, Lemon Squeezy sends your license key by email. It looks like this:

```
XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
```

Copy it and keep it somewhere safe — your password manager or a note. **Do not share it.** Each key allows activation on 1 device.

Lost your key? Log in at ten30studios.lemonsqueezy.com with your purchase email to retrieve it anytime.

2 Install Python (if needed)

OgunScan requires **Python 3.9 or higher**. Check if you have it:

```
python3 --version
```

If you see **Python 3.9+**, you're good. If not, download it free from python.org.

3 Install OgunScan

Mac

Windows

Linux

Open your terminal (Mac/Linux) or Command Prompt (Windows) and run:

```
pip install ogunscan
```

Wait for it to finish — usually under 30 seconds. Confirm it installed:

```
ogunscan --version
```

Mac/Linux tip: If you get a "command not found" error, try `pip3 install ogunscan` instead.

4 Activate Your Shield License

Run this command with your license key:

```
ogunscan --activate YOUR-LICENSE-KEY-HERE
```

Replace **YOUR-LICENSE-KEY-HERE** with the key from your email. You should see:

```
✓ Shield activated. Welcome to OgunScan Shield.
```

5 Run Your First Scan

Scan a local MCP server config:

```
ogunscan scan ./mcp-config.json
```

Scan a remote endpoint:

```
ogunscan scan --remote https://your-mcp-server.com
```

Export results as SARIF (for GitHub Actions / CI):

```
ogunscan scan ./mcp-config.json --output sarif --out results.sarif
```

✓ What's Included in Shield

- ✓ All free OgunScan features
- ✓ Remote endpoint scanning
- ✓ SARIF output for CI/CD pipelines
- ✓ GitHub Actions integration
- ✓ License key activation & management
- ✓ Priority support via admin@ten30studio.com
